

### 1W, FIXED INPUT, ISOLATED DUAL OUTPUT SMD DC-DC CONVERTER

- ◆Footprint over pins 1.64cm<sup>2</sup>
- ◆Short Circuit Protection(automatic recovery)
- ◆I/O isolation voltage 1000VDC
- ◆Operating Temperature: -40℃~ + 85℃
- ◆High efficiency up to 78%
- ◆Toroidal magnetics
- ◆Small SMD package with footprint
- ◆Power density 1.36W/cm<sup>3</sup>
- ◆Lead frame technology
- ◆Multi-layer ceramic capacitors
- ◆Custom solutions available

- ⑥ SMD Package

The A-NXT series are miniature, 1W DC/DC converters with high isolation in a SMD package. With a new package design these converters are qualified for the higher temperatures requested by lead-free reflow solder processes. With the small footprint, these converters are the ideal solution for board level power distribution, mainly for applications in the industrial and telecom field. For automated SMD production lines the devices can be supplied in standard tape and reel package.

**T T**

‘Hi Pot Test’, ‘Flash Tested’, ‘Withstand Voltage’, ‘Proof Voltage’, ‘Dielectric Withstand Voltage’ & ‘Isolation Test Voltage’ are all terms that relate to the same thing, a test voltage, applied for a specified time, across a component designed to provide electrical isolation, to verify the integrity of that isolation.

Professional Power Module A-NXT series of DC/DC converters are all 100% production tested at their stated isolation voltage. This is 1KVDC for 1 second.

A question commonly asked is, “What is the continuous voltage that can be applied across the part in normal operation?”

For a part holding no specific agency approvals, such as the A-NXT series, both input and output should normally be maintained within SELV limits i.e. less than 42.4V peak, or 60VDC. The isolation test voltage represents a measure of immunity to transient voltages and the part should never be used as an element of a safety isolation system. The part could be expected to function correctly with several hundred volts offset applied continuously across the isolation barrier; but then the circuitry on both sides of the barrier must be regarded as operating at an unsafe voltage and further isolation/insulation systems must form a barrier between these circuits and any user-accessible circuitry according to safety standard requirements.

It is well known that repeated high-voltage isolation testing of a barrier component can actually degrade isolation capability, to a lesser or greater degree depending on materials, construction and environment. The A-NXT series has toroidal isolation transformers, with no additional insulation between primary and secondary windings of enameled wire. While parts can be expected to withstand several times the stated test voltage, the isolation capability does depend on the wire insulation. Any material, including this enamel (typically polyurethane) is susceptible to eventual chemical degradation when subject to very high applied voltages thus implying that the number of tests should be strictly limited. We therefore strongly advise against repeated high voltage isolation testing, but if it is absolutely required, that the voltage be reduced by 20% from specified test voltage.

This consideration equally applies to agency recognized parts rated for better than functional isolation where the wire enamel insulation is always supplemented by a further insulation system of physical spacing or barriers.

**A N**

The minimum load to meet data sheet specification is 10% of the full rated load across the specified input voltage range. Lower than 10% minimum loading will result in an increase in output voltage, which may rise to typically double the specified output voltage if the output load falls to less than 5%.

Typical start up times for this series, with a typical input voltage rise time of 2.2  $\mu$ s and output capacitance of 10  $\mu$ F, are shown in the table below. The product series will start into a capacitance of 47  $\mu$ F with an increased start time, however, the maximum recommended output capacitance is 10  $\mu$ F.

	Start-up time		Start-up time
	$\mu$ s		$\mu$ s
A0303NXT	1630	A0509NXT	6850
A0305NXT	1359	A0512NXT	11560
A0309NXT	3435	A0515NXT	15640
A0312NXT	6590	A1205NXT	1154
A0315NXT	25340	A1209NXT	4050
A0503NXT	1599	A1212NXT	7995
A0505NXT	2185	A1215NXT	11200
A0305NXT	1395		

Ripple and noise measurements are performed with the following test configuration.

- C1 1  $\mu$ F X7R multilayer ceramic capacitor, voltage rating to be a minimum of 3 times the output voltage of the DC/DC converter
- C2 10  $\mu$ F tantalum capacitor, voltage rating to be a minimum of 1.5 times the output voltage of the DC/DC converter with an ESR of less than 100m $\Omega$  at 100 kHz
- C3 100nF multilayer ceramic capacitor, general purpose
- R1 450  $\Omega$  resistor, carbon film,  $\pm$ 1% tolerance
- R2 50  $\Omega$  BNC termination
- T1 3T of the coax cable through a ferrite toroid
- RLOAD Resistive load to the maximum power rating of the DC/DC converter. Connections should be made via twisted wires

Measured values are multiplied by 10 to obtain the specified values.

**A N**

By using the values of inductance and capacitance stated, the output ripple at the rated load is lowered to 5mV p-p max.

Capacitor: It is required that the ESR (Equivalent Series Resistance) should be as low as possible, ceramic types are recommended.

The voltage rating should be at least twice (except for 15V output), the rated output voltage of the DC/DC converter.

Inductor: The rated current of the inductor should not be less than that of the output of the DC/DC converter. At the rated current, the DC resistance of the inductor should be such that the voltage drop across the inductor is <2% of the rated voltage of the DC/DC converter. The SRF (Self Resonant Frequency) should be >20MHz.

Specifications can be changed any time without notice.

Note:

1. The load shouldn't be less than 10%, otherwise ripple will increase dramatically.
2. Operation under 10% load will not damage the converter; However, they may not meet all specification listed.
3. All specifications measured at Ta=25°C, humidity<75%, nominal input voltage and rated output load unless otherwise specified.
4. In this data sheet, all the test methods of indications are based on corporate standards.
5. Only typical models listed, other models may be different, please contact our technical person for more details.
